

# **Use Instruction - Human Interferon-Stimulated Gene CRISPR Knockout Library**

## **Product Info**

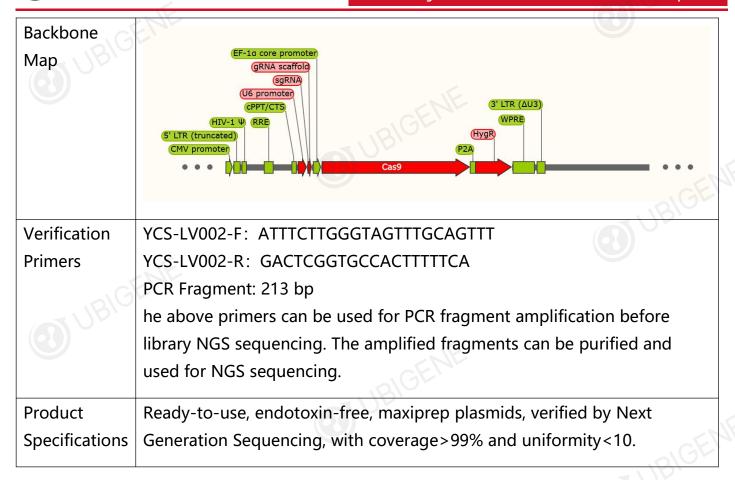

The CRISPR knockout library targets 1,902 human interferon stimulated genes with a total of 15,416 knockout plasmid vectors, of which 8 different gRNA vectors are designed for each gene, in addition to 200 control vectors targeting intergenic sequences. The library uses YCS-LV002 as the backbone, which is a single-plasmid system that expresses both gRNA and Cas9 gene and can be used directly.

# **Library Details**

Product	Human Interferon-Stimulated Gene CRISPR Knockout Library		
Name			
Product	LIBR-H069-P		
Catalog			
Product	15416gRNAs (gRNA sequences see attachment);		
Details	Single-plasmid system, can be directly used for library screening without		
	first constructing Cas9 stable cell lines;		
	Hygro resistance, can be used for antibiotic screening upon cell infection;		
	Plasmids paired with 3rd lentivirus packaging system can be directly used		
	for virus packaging.		
	* It is recommended to use Ubigene's Lentiviral Packaging Kit(Cat# YK-LVP-05)		
	Targeting 1902 genes,8gRNAs per gene;		
	200non-target control sgRNAs (200 targeting non-genic sequences) .

## **Product Use Instruction**

#### **Part 1. Lentivirus Packaging**

Mix library plasmid constructs with 3rd generation lentiviral packaging constructs to be cotransfected into 293T cells (Recommend: Ubigene's 293T cell line specialized for virus packaging, cat#YC-A006). 48 or 72 hours upon transfection, collect lentiviral supernatant and the virus can be used upon concentration. The virus should be stored at -80°C.

### Part 2. Library Plasmid Amplification

1.Library plasmid electroporation

Add50 ng library plasmid to 25 µL electrocompetent cells with transformation efficiency≥10^9 cfu/ug, electroporate cells as per electroporation parameters.Upon electroporation, add 975 µL recovery medium, mix well and transfer to a tube, then add 1 ml recovery medium to the tube and mix well again. Repeat above steps for ≡ times and get 4 electroporation end products, share the tubes at 37°C, 250 rpm for 1 hour. 2. Culture of amplified library and calculation of transformation efficiency

Tel: +86 153 6067 3248(Int'I) US Toll free: 855 777 3210 EU Toll free: 800 3272 9252

Korea Toll free: 001 800 3272 9252

- 1) Mix the 4 tubes of electroporation end products and take 10 µL and dilute with 990 µL recovery medium. Plate 20 µL dilution onto a 10 cm Petri dish and incubate plates at 32°C for 14 hours. Count the colonies in the dish. If the number of colonies is 40000X greater than 4.62 x 10<sup>6</sup>, move on to the next step. If it is less than 4.62 x 10<sup>6</sup>, redo this step.
- \* Note: It is recommended that the number of colonies should be 40000X greater than 7.71 x 10<sup>6</sup> to ensure the uniformity of Library gRNA.
- 2) For the remaining electroporation end products, plate 400 µL/dish (20dishes can be plated in total), then incubate at 37°C for overnight.
- 3. Collect transformation products
  - 1) Collect the bacteria to a 50 mL centrifuge tube.
  - 2) Centrifuge tubes to pellet bacteria, decant LB and weigh pellet (bacteria).

#### 4.Maxiprep

Maxiprep the plasmid DNA according to the instruction for maxiprep kit, it is recommended to use endofree maxiprep kit from well-known, commercial brands such as QIAGEN and MACHEREY-NAGEL. (E.g. EndoFree Plasmid Mega Kit from QIAGEN)

#### **Part 3. Library Screen**

#### 1.Determine infect MOI

Dilute the library virus into different gradients, such as MOI=0.3, 0.5, 1, 5, 10, 30, 100 to infect the target cells (the cell confluency is 30-50%). Each gradient needs to be set with 2 wells. After 48 hours of infection, add puromycin according to the settings in the table below for screening, and stop antibiotic screening when all cells in the blank group (cells not infected with virus) die. The MOI with a survival rate of 30% after antibiotic screening is the virus infection condition for the library screening experiment, that is, infect MOI.

Group#	MOI	Antibiotic	Cell amount	Survival rate
		screening	upon antibiotic	upon antibiotic
		_	screening	screening
Experimental	0.3	Yes	N1	N1/M1
group 1	JE.			
Experimental group 1	0.5	Yes	N2	N2/M2
Experimental	1	Yes	N3	N3/M3

group 3				
Experimental group 4	5	Yes	N4	N4/M4
Experimental group 5	10	Yes	N5	N5/M5
Experimental group 6	30	Yes	N6	N6/M6
Experimental group 7	100	Yes	N7	N7/M7
Infection blank group 1	0.3	No	M1	
Infection blank group 2	0.5	No	M2	
Infection blank group 3	1	No	M3	
Infection blank group 4	5	No	M4	
Infection blank group 5	10	No	M5	
Infection blank group 6	30	No	M6	- IBIG
Infection blank group 7	100	No	M7	<u> </u>
Blank group	0	Yes		

2. Transduction with library virus

Tel: +86 153 6067 3248(Int'l) US Toll free: 855 777 3210 EU Toll free: 800 3272 9252 Korea Toll free: 001 800 3272 9252

1) Determine the amount of cells and virus

Cell amount = gRNA# × gRNA coverage / 30% \* gRNA coverage > 500 fold Virus amount = cell amount × infect MOI

- ②Expand the cells according to the cell amount calculated in step ①, and prepare sufficient virus.
- 3 Use library virus to infect the target cells, upon Hygro screening, divide the screened cells into experimental group and control group. Add target drugs to the experimental group for screening, upon screening, collect cells respectively from experimental group and control group (It is recommended to get at least 7.71 x 10<sup>6</sup> cells from control group; get all the cells from experimental group and the cell amount before cryopreservation should be greater than 2\*10^6). Perform genome extraction for Next Generation Sequencing, and then compare and analyze the gRNAs of the experimental group and the control group.

# Relevant products and service

Ubigene provides off-shelf libraries including Human/Mouse genome-wide plasmid library and some sub-libraries, and one-stop customized screening services for CRISPR-KO, CRISPRa, and CRISPRi including high-throughput sgRNA library construction, virus packaging, cell infection, drug screening, NGS sequencing, and data analysis, etc. Multiple deliverables fulfill different research needs!
